

CSCI 338: Assignment 3 (6 points)

Elliott Pryor

March 10, 2020

This assignment is due on **Tuesday, March 10, 11:30pm**. It is strongly encouraged that you use Latex to generate a single pdf file and upload it under *Assignment 3* on D2L. But there will NOT be a penalty for not using Latex (to finish the assignment). This is **not** a group-assignment, so you must finish the assignment by yourself.

Problem 1

Design context-free grammars for the following languages

(1.1) $A = \{a^n b^m \mid n \neq 2m\}$.

- $S = aaSb \mid A \mid B$
- $A = aA \mid a$
- $B = bB \mid b$

(1.2) $B = \{a^i b^j c^k \mid i, j, k \geq 0 \text{ and either } i = j \text{ or } j = k\}$.

- $S = XC \mid AY$
- $A = aA \mid \epsilon$
- $C = cC \mid \epsilon$
- $X = aXb \mid \epsilon$
- $Y = bXc \mid \epsilon$

(1.3) $C = \{a^n b^m \mid n = 3m\}$.

COMPUTER SCIENCE THEORY: ASSIGNMENT 3

- $S = aaaSb|\epsilon$

(1.4) $D = \{a^n b^m | n \leq m + 3\}.$

- $S = aSb|Sb|A$
- $A = aaa|aa|a|\epsilon$

Problem 2

Decide whether the following grammar is ambiguous.

$$S \rightarrow AB|aaB$$

$$A \rightarrow a|Aa$$

$$B \rightarrow b$$

S	S
AB	aaB
AaB	aaB
aaB	aaB
aab	aab

There are multiple ways to generate the string “aab” with this grammar, so **yes** the grammar is ambiguous.

Problem 3

Convert the following CFG G to an equivalent PDA.

$$R \rightarrow XRX|S$$

$$S \rightarrow aTb|bTa$$

$$T \rightarrow XTX|X|\epsilon$$

$$X \rightarrow a|b$$

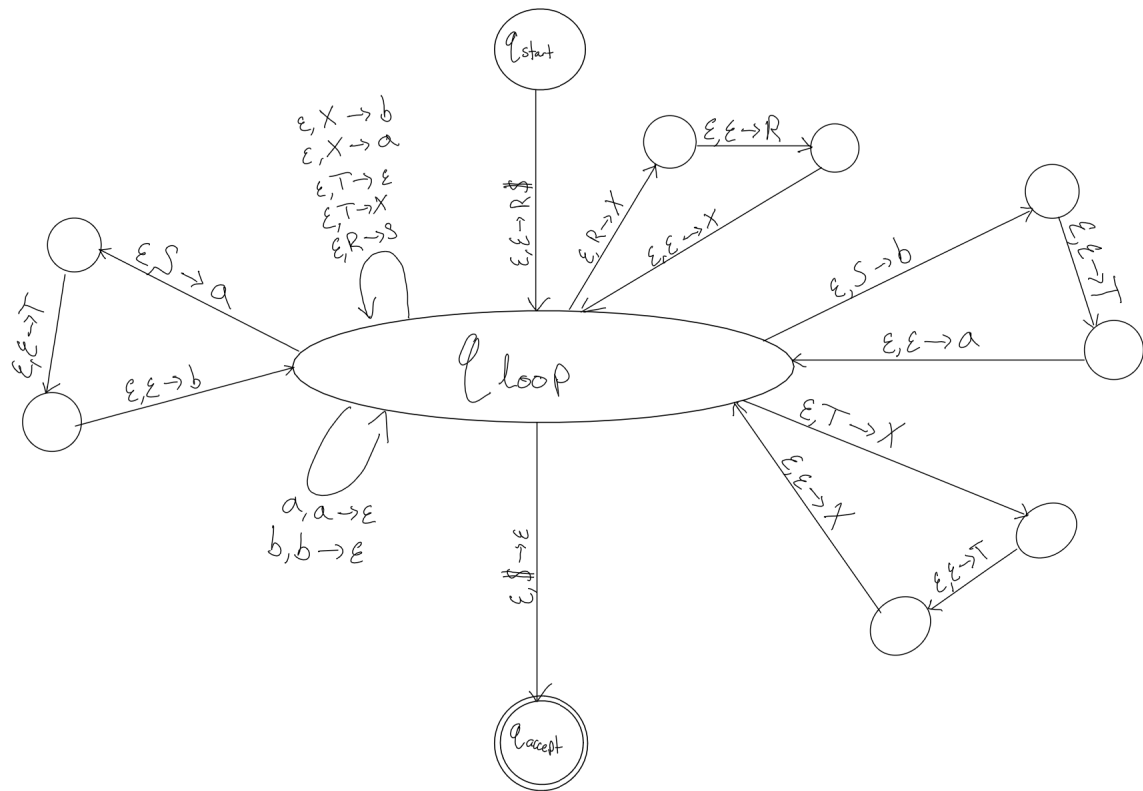

Figure 1: Solution to Problem 3

Problem 4

Let $G = (V, \Sigma, R, S)$ be the following grammar. $V = \{S, T, U\}$; $\Sigma = \{0, \#\}$; and R is the set of rules:

$$S \rightarrow TT|U$$

$$T \rightarrow 0T|T0|\#$$

$$U \rightarrow 0U00|\#$$

(4.1) Describe $L(G)$ in English.

$L(G)$ has two $\#$'s within a list of zeros. Or $L(G)$ a single $\#$ one third of the way through a list of zeros with a multiple of three length. Ie. it has a list of n zeros, a single $\#$ then a list of $2n$ zeros.

(4.2) Prove that $L(G)$ is not regular.

PROOF. By Contradiction.

Assume that $L(G)$ is regular. Then we pick $S = 0^p \# 0^{2p}$

By the pumping lemma, S can be decomposed into xyz s.t.

$$(1) \ xy^iz \in A \text{ for } i \geq 0$$

$$(2) \ |y| > 0$$

$$(3) \ |xy| \leq p$$

Let $i = |y|$, then by (2) $i = |y| > 0$, and by (3) $|xy| \leq p$ so y must consist of only zeros. We pump up $xy^2z = 0^{p+i} \# 0^{2p} \notin L$ because we increased the number of zeros before the $\#$ without changing those after it, so $2(p+i) \neq 2p$.

A contradiction of the pumping lemma, so L must not be regular.

□

Problem 5

Convert the following CFG into an equivalent CFG in Chomsky Normal Form

$$A \rightarrow BAB|B|\epsilon$$

$$B \rightarrow 00|\epsilon$$

$$S_0 \rightarrow BC|AB|BA|BB|XY$$

$$A \rightarrow BC|AB|BA|BB|XY$$

$$B \rightarrow XY$$

$$C \rightarrow AB$$

$$X \rightarrow 0$$

$$Y \rightarrow 0$$

Start

$$A \rightarrow BAB|B|\epsilon$$

$$B \rightarrow 00|\epsilon$$

add S_0

$$S_0 \rightarrow A$$

$$A \rightarrow BAB|B|\epsilon$$

$$B \rightarrow 00|\epsilon$$

Remove ϵ rules

$$B \rightarrow \epsilon$$

$$S_0 \rightarrow A$$

$$A \rightarrow BAB|AB|BA|A|B|\epsilon$$

$$B \rightarrow 00$$

$$A \rightarrow \epsilon$$

$$S_0 \rightarrow A|\epsilon$$

$$A \rightarrow BAB|AB|BA|BB|A|B$$

$$B \rightarrow 00$$

$$S_0 \rightarrow \epsilon$$

$$S_0 \rightarrow A$$

$$A \rightarrow BAB|AB|BA|BB|A|B$$

$$B \rightarrow 00$$

remove single variable rules

$$A \rightarrow A$$

$$S_0 \rightarrow A$$

$$A \rightarrow BAB|AB|BA|BB|B$$

$$B \rightarrow 00$$

$$A \rightarrow B$$

$$S_0 \rightarrow A$$

$$A \rightarrow BAB|AB|BA|BB|00$$

$$B \rightarrow 00$$

$$S_0 \rightarrow A$$

$$S_0 \rightarrow BAB|AB|BA|BB|00$$

$$A \rightarrow BAB|AB|BA|BB|00$$

$$B \rightarrow 00$$

Add variables for constants in CNF

$$S_0 \rightarrow BC|AB|BA|BB|XY$$

$$A \rightarrow BC|AB|BA|BB|XY$$

$$B \rightarrow XY$$

$$C \rightarrow AB$$

$$X \rightarrow 0$$

$$Y \rightarrow 0$$

Figure 2: Work for Problem 5

Problem 6

Using pumping lemma to prove that the following languages are not context-free.

(6.1) $L = \{a^n b^j c^k \mid k = nj\}.$

PROOF. By Contradiction

Assume that L is regular. Then pick $S = a^p b^p c^{p^2}$ where p is the pumping length. Then by the pumping lemma S can be decomposed into $S = uvxyz$ st.

- (1) $uv^i xy^i z \in L$ for $i \geq 0$
- (2) $|vy| > 0$
- (3) $|vxy| \leq p$

We examine three cases:

- 1. vxy contains b 's and c 's. Pumping up, $uv^2 xy^2 z$ is of the form $a^p b^{p+i} c^{p^2+j}$. Then $p(p+i) = p^2 + ip > p^2 + j$ because $i > 0$ therefore $j < p$ by (3). Therefore $uv^2 xy^2 z \notin L$
- 2. vxy contains no c 's. Then, we pump up $uv^2 xy^2 z \notin L$ by (2), $|vy| > 0$ so there is more a 's or b 's without changing the number of c 's.
- 3. vxy contains only c 's. Then, we pump up $uv^2 xy^2 z \notin L$ by (2), $|vy| > 0$ so there is more c 's without changing the number of a 's or b 's.

Thus a contradiction in all cases, so L is not regular.

□

(6.2) $L = \{a^n b^j \mid n \geq (j-1)^3\}.$

PROOF. By Contradiction

Assume that L is regular. Then pick $S = a^{(p-1)^3} b^p$ where p is the pumping length. Then by the pumping lemma S can be decomposed into $S = uvxyz$ st.

- (1) $uv^i xy^i z \in L$ for $i \geq 0$
- (2) $|vy| > 0$

$$(3) \quad |vxy| \leq p$$

We examine three cases:

1. vxy consists only of a 's. We pump down so $uv^0xy^0z = uxz$. By (2) $i = |vy| > 0$, so uxz has the form $a^{(p-1)^3-i}b^p$, but $(p-1)^3 - i < (p-1)^3$. Therefore $uxz \notin L$.
2. vxy contains both a 's and b 's. We pump up, uv^2xy^2z is of the form $a^{(p-1)^3+i}b^{p+j}$. We know that $j \neq 0$ so $(p+j-1)^3 \leq p^3$, and $i < p$ by (3). Then $(p-1)^3 + i < (p-1)^3 + 3p^2 - 3p + 1 = p^3$ for $p > 1$. Therefore $(p-1)^3 + i < (p+j-1)^3$. Therefore $uxz \notin L$.
3. vxy contains only b 's. We pump up, uv^2xy^2z is of the form $a^{(p-1)^3}b^{p+i}$. By (2), $i = |vy| > 0$, so we increase the number of b 's without altering the number of a 's. Then $(p-1)^3 < (p+i-1)^3$, therefore $uxz \notin L$.

Thus a contradiction in all cases, so L is not regular.

□
